Sequence 2, Application US/09677374

Sequence 2, Application US/09677374

GENERAL INFORMATION:
APPLICANT: Burian, Jan
APPLICANT: Kayzk, Michael
APPLICANT: Thornton, Julian
TITLE OF INVENTION: VACCINES AND AGENTS FOR INDUCING IMMUNITY AGAINST
TITLE OF INVENTION: RICKETTSIAL DISEASES, AND ASSOCIATED PREVENTATIVE THERAPY
FILE OF INVENTION: RICKETTSIAL DISEASES, AND ASSOCIATED PREVENTATIVE THERAPY
FILE OF INVENTION: RICKETTSIAL DISEASES, AND ASSOCIATED PREVENTATIVE THERAPY
FILE OF INVENTION NUMBER: US/09/677,374

CURRENT APPLICATION NUMBER: US 60/154,437

PRIOR APPLICATION NUMBER: IE 2000/0752

PRIOR PILING DATE: 2000-09-15

PRIOR APPLICATION NUMBER: EB 000-09-18

TITLE OF INVENTION: STREPTAVIDIN EXPRESSED GENE FUSIONS AND
TITLE OF INVENTION: METHODS OF USE THEREOF
FILE REFERENCE: 69012-14701PC
CURRENT APPLICATION UNBER: PCT/US02/39429
CURRENT FILING DATE: 2002-12-06
NUMBER OF SEQ ID NOS: 92
SOFTWARE: FastSEQ for Windows Version 4.0
SEQ ID NO 8
LENGTH: 413
TYPE: PRT
ORGANICM: Artificial Sequence
FRATURE:
FRATURE:
COTHER INFORMATION: Predicted amino acid sequence of B9E9 single chain antibody- gence

This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a p. salmonis specific antigen termed OspA, or an immunogenic fragment of particularly poikilothermic fish, against the bacterial pathogen particularly poikilothermic fish, against the bacterial pathogen rickettsial septicaemia (SRS) and other rickettsial against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents P. salmonis OspA protein. An OspA protein with an Alternian and fusion partner is used in a vaccine to create an anti-OspA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       VLGGLIGSKIGQSMDQQDKIKLNQSLEKVKAGQVTRWRNPDTGNSYSVEPVRTYQRYNKQ 120

This invention relates to a method for the protection against infection of a poixilothermic fish by the bacterial pathogen, Piscirickettsia asalmonis. The method comprises administering an immunogenic amount of a pealmonis specific antigen termed 05pA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly polkilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents optimised P. salmonis OspA protein 1782. The DNA encoding OspA 1782 (Ar86247) has been optimised for expression in Ecsherichia coli. An OspA protein with an N-terminal fusion partner is used in a vaccine to create an anti-OspA antibody response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GGLIGSKIGQSMDQQDKIKLNQSLEKVKAGQVTRWRNPDTGNSYSVEPVRTYQRYNKQER 122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Method for protecting polkilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis

                                      The invention describes a method of protecting a poikilothermic fish against infection by the bacterial pathogen Piecirickettsia Salmonis comprising administering either intraperitoneally, by immersion or oxally, an immunogenic amount of principal antigen, the OspA (outer surface lipoprotein), its variants, non-lipidated form or antigenic peptides derived or synthesized with or without an adjuvant. The new method is used to provide an outer surface lipoprotein (OspA) of bacterial strain Piscirickettsia salmonis as a vaccine to induce immunity in fin-fish against Rickettsial septicemia and other related this is the amino acid sequence of the Piscirickettsia salmonis outer wirtage in provide in outer surface lipoprotein, OspA, used in the creation of the vaccine described in the interval of the vaccine described in the interval of the vaccine described in the creation of the vaccine described

                                                                                         The invention describes a method of protecting a poikilothermic fish against infection by the bacterial pathogen Piscirickettsia Salmonis comprising administering either intraperitoneally, by immersion or orally, an immunogenic amount of principal antigen, the OspA (outer surface lipoprotein), its variants, non-lipidated form or antigenic peptides derived or synthesized with or without an adjuvant. The new method is used to provide an outer surface lipoprotein (OspA) of bacterial strain Piscirickettsia salmonis as a vaccine to induce immunity in fin-fish against Rickettsial septicaemia and other related immunity in fin-fish against Sickettsial septicaemia and other related This is the amino acid sequence of the Escherichia coli codon optimised outer surface lipoprotein OspA (17e2) used in the creation of the vaccine described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GGLIGSKIGOSMDQODKIKLNQSLEKVKAGQVTRWRNPDTGNSYSVEPVRTYQRYNKQER 122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       96..256

This invention relates to a method for the protection against infection of a poixilothermic fish by the bacterial pathogen, Piscirickettsia asalmonis. The method comprises administering an immunogenic amount of a p. salmonis specific antiqen termed 05p4, or an immunogenic fragment of 0spA in the form of a vaccine. The method is used for protecting animals, particularly poixilothermic fish, against the bacterial pathogen p. salmonis. The method is also useful for protecting against salmonis rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents the amino acid sequence of C17E2, a P. salmonis construct optimised for expression in Escherichia coli, fused to an undefined N-terminal fusion patriner. The fusion protein is used in a vaccine to create an anti-OspA antibody response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GGLIGSKIGQSMDQQDKIKLNQSLEKVKAGQVTRWRNPDTGNSYSVEPVRTYQRYNKQER 122

modulating blofilm formation by bacteria. The method of the invention is useful for identifying a compound capable of modulating blofilm formation by bacteria. The method of the invention is acquaint bacterial antibiotic resistence. The method of the invention is also useful for diagnosing and treating a subject (especially an immunocompromised human) that is afflicted with a biofilm-associated disease or disorder, such as: cystic fibrosis; AIDS; middle ear infections; and medical device-associated infections, and medical device-associated infections. The present amino acid sequence represents a protein that is used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              QIAGTAIGAVVGGLLGNQIGGGTGKKIATVAGAVGGGYAGNKVQEGMQERDTYTTTETRC 129

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a method of protecting a poikilothermic fish against infection by the bacterial pathogen Pisciricketteia Salmonis comprising administering either intraperitoneally, by immersion or orally, an immunogenic amount of principal antigen, the OspA (outer peptides lipoprotein), its variants, non-lipidated form or antigenic peptides derived or synthesized with or without an adjuvant. The new method is used to provide an outer surface lipoprotein (OspA) of bacterial strain Piscirickettsia salmonis as a vaccine to induce immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GGLIGSKIGQSMDQQDKIKLNQSLEKVKAGQVTRWRNPDTGNSYSVEPVRTYQRYNKQER 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                in fin-fish against Rickettsial septicaemia and other related Rickettisial diseases caused by either a virus, bacteria or parasite. This is the amino acid sequence of the Escherichia coli codon optimised outer surface lipoprotein OspA (1722) with an N-terminal fusion used in the creation of the vaccine described in the invention.

                                                              This invention relates to a method for the protection against infection of a poixilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed osph, or an immunogenic fragment of osph in the form of a vaccine. The method is used for protecting animals, particularly polkilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents an immunogenic epitope of the P. salmonis osph protein. The peptide is used to raise rabbit anti-Osph antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a method of protecting a polkilothermic fish against infection by the bacterial pathogen Piscirickettsia Salmonis comprising administering either intraperitoneally, by immersion or orally, an immunogenic amount of principal antigen, the OspA (outer surface lipoprotein), its variants, non-lipidated form or antigenic peptides derived or synthesized with or without an adjuvant. The new method is used to provide an outer surface lipoprotein (OspA) of
                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inducing immunity in fin fish to Rickettsial septicaemia, comprises administration of an outer surface lipoprotein (OspA) of a bacterial strain, as a vaccine -

                                                                                                                                                                                             3
                                                                          The present invention provides the protein and coding sequences of proteins from Moraxella catarrhalis. These can be used to produce accines which protect against M. catarrhalis infection, which can cause otitis media, respiratory infection, sinusitus, and pneumonia. The present sequence is a protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a new hyperblebbing Gram-negative bacterium genetically modified by one or more processes selected from down-regulating expression of one or more Tol genes and attenuating the peptidoglycan-binding activity by mutation of one or more gene(8) encoding a protein comprising a peptidoglycan-associated site. The invention is useful in a method of treatment of the human or animal body. The invention is also useful for protecting an individual against a bacterial infection. The invention has improved outer-membrane vesicle-shedding properties. Blebs are more easily made in higher yield from the invention, and are more homogeneous in nature and can be more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel hyperblebbing Gram-negative bacterium that has been genetically modified by down-regulating expression of Tol genes, and/or attenuating peptidoglycan-binding activity useful for treating bacterial infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hyperblebbing, Gram-negative bacterium; genetically modified, Tol gene peptidoglycan-basociated site, outer-membrane; bacterial infection; vesicle-shedding; Bleb; filter sterilised; detergent; deoxycholate; homogeneity; antibacterial; vaccine;

polynucleotide encoding such a polypeptide. A claimed method of diagnosing a Moraxella infection involves identifying a BASB113 polypeptide or antibody. A claimed therapeutic composition useful in treating humans with M. catarrhalis infection comprises at least lantibody directed against a BASB113 polypeptide. BASB113 polypeptides also have utility in raising specific antibodies, and in screening for antibacterial drugs.

isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation be used to prophorymonas gingivalis in standard hybridisation especially gingivitis. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAX91536 to AAX91801 encode two hundred and sixty six antigenic

              the use of detergents such as deoxycholate, thus obviating chromatography purification and ultra centrifugation steps. Vesicles prepared from the invention have reduced particle size (allowing sterile filtration through 0.22 mum pores), increased batch homogeneity, and a superior yield. The present amino acid sequence represents a Moraxella catarrhalis protein, as described in the invention.

```
cc isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be cc used as vaccines especially against Porphorymonas gingivalis. Probes can cc used as vaccines especially against Porphorymonas gingivalis in standard hybridisation cc assays. Porphorymonas gingivalis is involved in periodontal disease cc cypecially gingivitis.

Sequence 4253, Application US/09328352

Sequence 4253, Application US/09328352

Patent No. 6562958

GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 4253
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GENERAL INFORMATION:
